Troubleshooting evolution

- ◆ Back in the olds days.
- ◆ Connecting to a BBS with a modem was how we could get information and hotfixes....

Good old days...

Troubleshoot GPO/ConfigMgr

- ◆ Many, many log files
- ◆ Server sides/client side
- ◆ Complex but can see everything

Group Policies

- ◆ Gpresult
- ◆ RSOP
- ◆ GPupdate

Troubleshooting Intune

- ◆ Log files -> event log
- ◆ Registry values
- ◆ SyncML
- ◆ IME agent = log files 😊

New tools:

- ◆ Copilot
- ◆ Copilot for security
- ◆ ChatGPT...
- ◆ Community tools... Lots of them

When do we need to troubleshoot?

- ◆ What is the expectation? Should it actually work like this?
- ◆ Configuration is indeed wrong
- ◆ Always check Service Health and message center

The screenshot displays the 'Service health and message center' page. It is divided into three main sections: 'Service health', 'Issues in your environment that require action', and 'Message center'. Each section includes a search bar, a filter icon, and an 'Add filters' button. The 'Service health' section shows one active incident. The 'Issues in your environment that require action' section shows no active incidents. The 'Message center' section shows 13 active messages.

Service health 1 active

Summary Devices Groups Policy Applications App protection policy Updates Enrollment restrictions Diagnostics

Policy

Compliant	Error	Non compliant	Conflict	Pending	Not applicable
263	21	1	18	0	14

Compliance

Compliant	Error	Non compliant	Conflict	Pending	Not applicable
16	0	8	0	0	10

Who made a change?

- ◆ Audit Logs for the win!
- ◆ Send diagnostic settings to:
 - ◆ Log Analytics
 - ◆ Storage account
 - ◆ Stream to event hub
 - ◆ Partner solution

Diagnostic setting ...

Save Discard Delete Feedback

A diagnostic setting specifies a list of categories of platform logs and/or metrics that you want to collect from a resource, and one or more destinations that you would stream them to. Normal usage charges for the destination will occur. [Learn more about the different log categories and contents of those logs](#)

Diagnostic setting name *

Logs	Destination details
Categories	
☒ AuditLogs	☒ Send to Log Analytics workspace
☐ OperationalLogs	☐ Archive to a storage account
☐ DeviceComplianceOrg	☐ Stream to an event hub
☐ Devices	☐ Send to partner solution
☐ Windows365AuditLogs

DEMO

Subscription Based activation

- ◆ Easiest way of upgrading to Enterprise from pro
- ◆ Re-activated every 30 days
- ◆ Each user can activate 5 devices
- ◆ Activating shared devices
 - ◆ Either all users must have a Windows e3 license assigned
 - ◆ Shared devices must be excluded and activated in a different way (KMS, MAK)
 - ◆ HKEY_Local_Machine\System\Currentcontrolset\services\clipsvc\parameters
 - ◆ Value: DisableSubscription Reg_Dword Value=1

<https://learn.microsoft.com/en-us/windows/deployment/windows-10-subscription-activation#existing-enterprise-deployments>

Subscription based activation

- ♦ Important: Devices will automatically “migrate” from MAK, KMS and AD-based activation to Subscription when a user with an assigned license logs on.
- ♦ Blocked by the “Work or school account problem”
- ♦ Exclude **Windows Store for business: AppID 45a330b1-b1ec-4cc1-9161-9f03992aa49f** from your Conditional Access framework.

More than Intune policies

Troubleshooting Policies

Policy/Profile Conflicts

- ♦ Intune policies are compiled server side!
- ♦ Compliance policy settings always have precedence over configuration profile settings.
- ♦ Compliance policy conflicts: The most restrictive compliance policy setting applies.
- ♦ Conflict is shown in Intune. Manually resolve these conflicts.
- ♦ Some conflicts are shown as error depending on setting type.

Removing a policy

- ◆ Does not necessarily change the value back, depends on the CSP

ⓘ Note

When a profile is removed or no longer assigned to a device, different things can happen, depending on the settings in the profile. The settings are based on CSPs, and each CSP can handle the profile removal differently. For example, a setting might keep the existing value, and not revert back to a default value. The behavior is controlled by each CSP in the operating system. For a list of Windows CSPs, see [configuration service provider \(CSP\) reference](#).

To change a setting to a different value, create a new profile, configure the setting to **Not configured**, and assign the profile. Once applied to the device, users should have control to change the setting to their preferred value.

When configuring these settings, we suggest deploying to a pilot group. For more Intune rollout advice, see [create a rollout plan](#).
