

Securing Azure Virtual Desktop

Recommendations to help make your AVD environment more secure.

Attention

- ◆ MMS sessions are 60-75 minutes followed by LONG Q&A
- ◆ Please hold detailed questions until that Q&A starts
- ◆ Feel free to ask clarification questions
- ◆ Remind the speakers to use Zoom It when you can't see

Intro to AVD

Azure Virtual Desktop is a cloud VDI solution designed to meet the challenges of remote work

Enable a
secured,
remote desktop
experience
from anywhere

Access Windows 11 and Windows 10 from anywhere

Maintain full control over configuration and management

Get the security and reliability of Azure

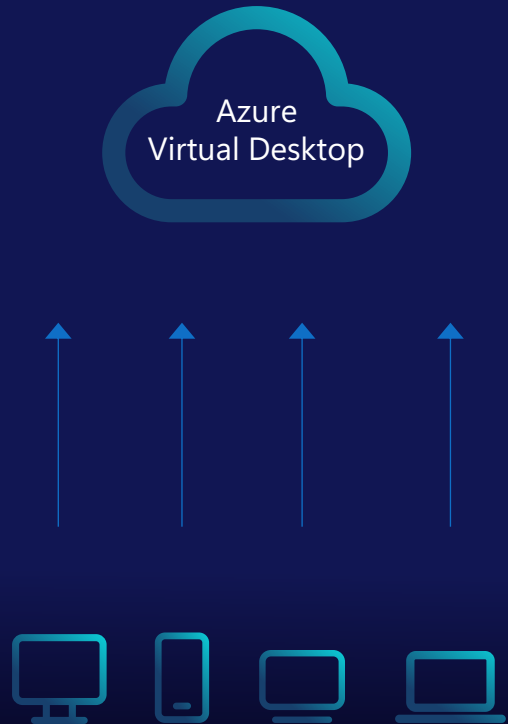

Optimize cost with multi-session and pay for only what you use

Here's what you can do when you run Azure Virtual Desktop

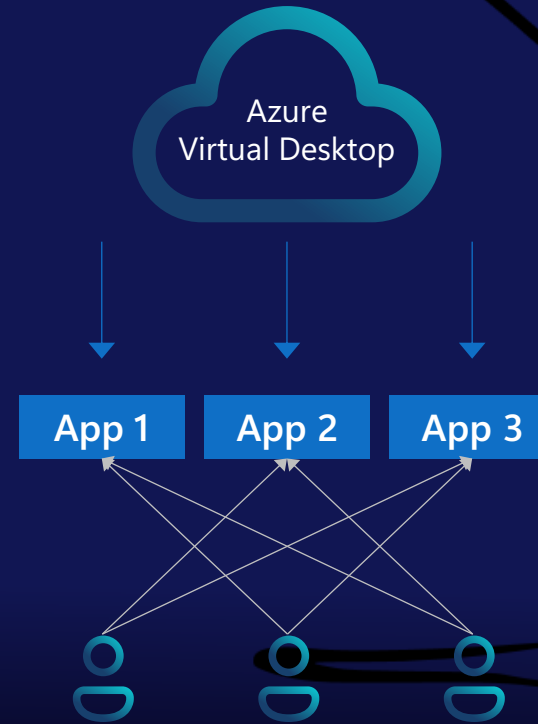

Access your org's apps from anywhere on any device

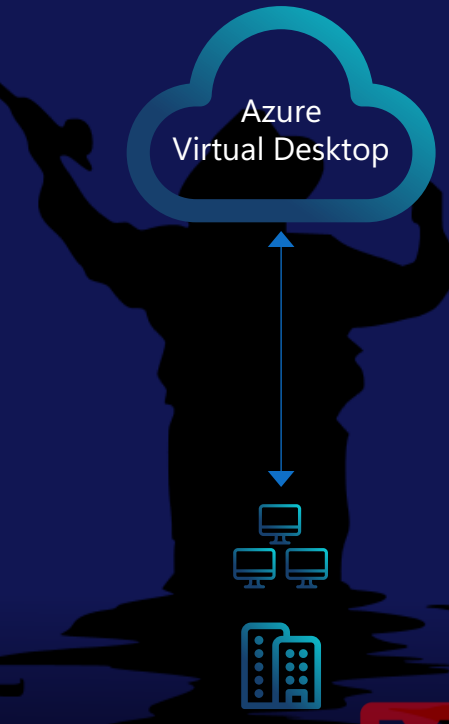

Create secured, customized PC experiences for every user

"SaaSify" your custom apps and stream them to users

Gain efficiencies by migrating existing VDI to the cloud

Azure Virtual Desktop

Provide your employees with a full desktop and access to remote apps.

Focus on policies and controls rather than managing infrastructure.

Connect from any device of your choice.

Desktops & remote apps

Full desktop

Remote app

Management & policies

Image, app, and profile management

User density, VM sizing, and scaling policies

User management and identity

Networking policies

Azure Virtual Desktop service

Cloud VDI can provide a flexible, cost-effective way to address current IT challenges and unlock new use cases

Data security

High-capacity computing

BYOPC programs

Disaster recovery

Temporary workforces

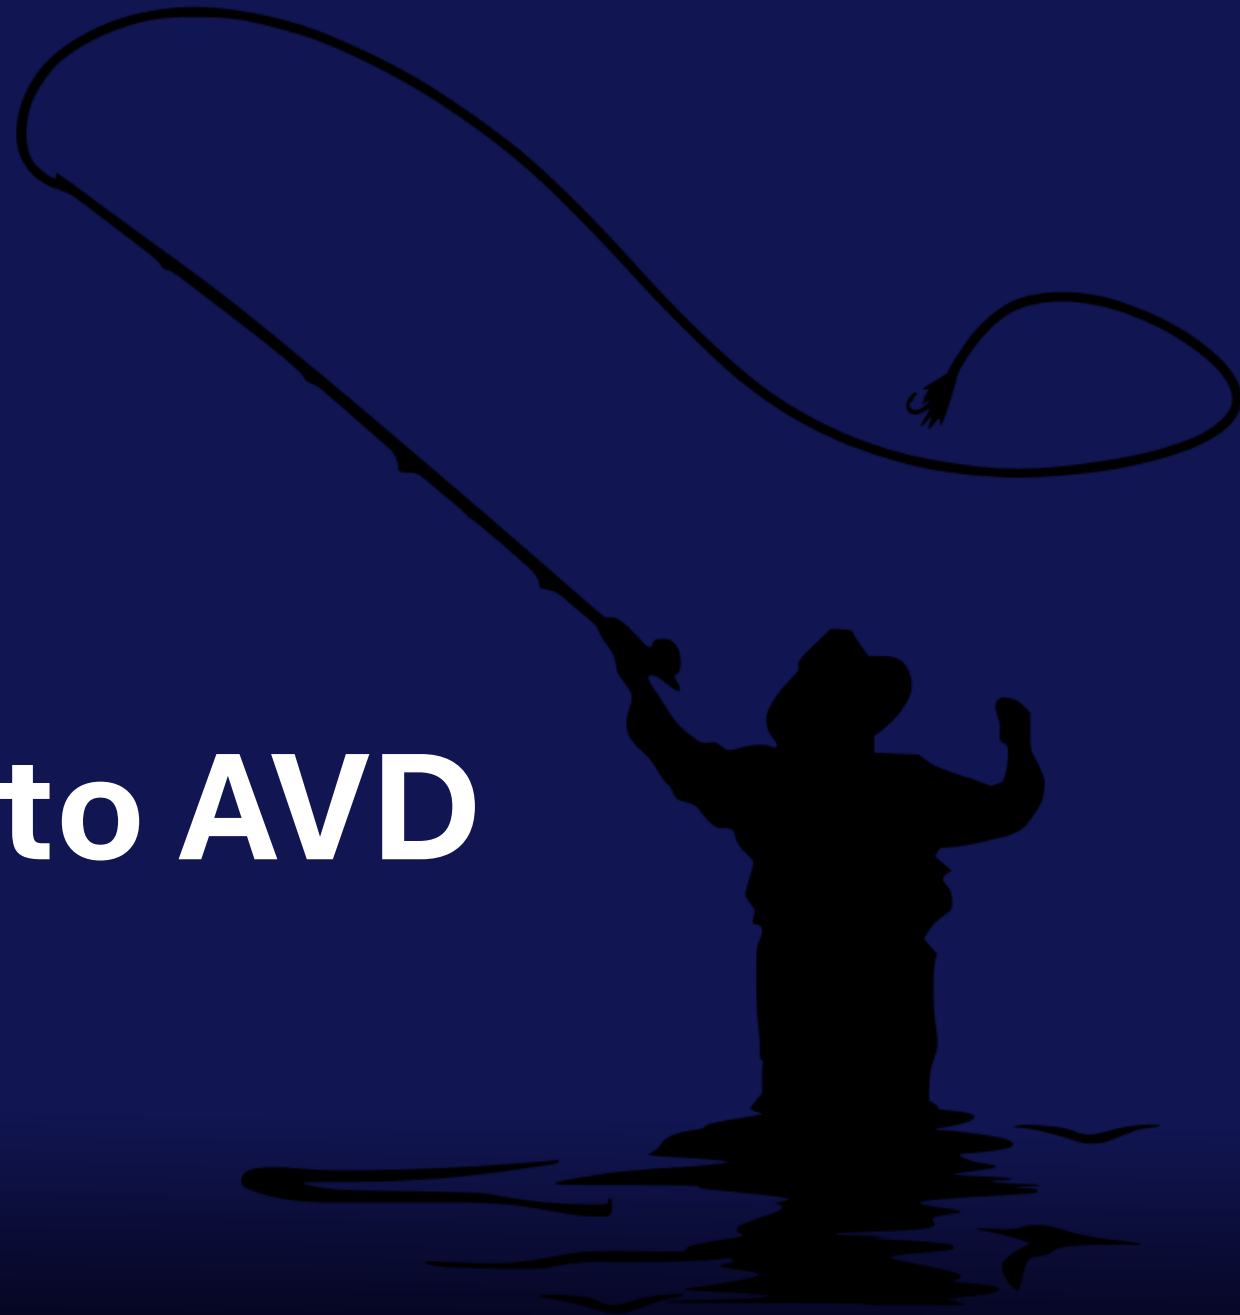

Mergers & Acquisitions

What you need to get started with Azure Virtual Desktop

Azure Portal	Microsoft Entra ID Active Directory	Windows 11/10 Enterprise Windows Server 2012 R2 and up Windows 11/10 Enterprise multi-session	Azure ExpressRoute	Microsoft 365	Azure Virtual Desktop
An Azure account with an active subscription	An identity provider	A supported operating system	Network connectivity	Appropriate licenses	A remote desktop client
Azure Virtual Desktop configuration, monitoring, and management happens in the Azure Portal. Admins need an account with the necessary privileges to start an Azure Virtual Desktop implementation.	Identity providers allow for granular control of user access to Azure Virtual Desktop resources. Microsoft Entra ID provides identity management for Azure Virtual Desktop.	Azure Virtual Desktop resources are delivered through virtual machines running Windows operating systems. You can choose from a broad set of available OS images or create your own.	Users can connect to Azure Virtual Desktop from anywhere. Customers can also use Azure ExpressRoute to link on-premises infrastructure to Azure Virtual Desktop services.	Many customers are already entitled to access Azure Virtual Desktop resources through existing eligible licenses.	Users can access Azure Virtual Desktop resources through a variety of remote desktop clients.

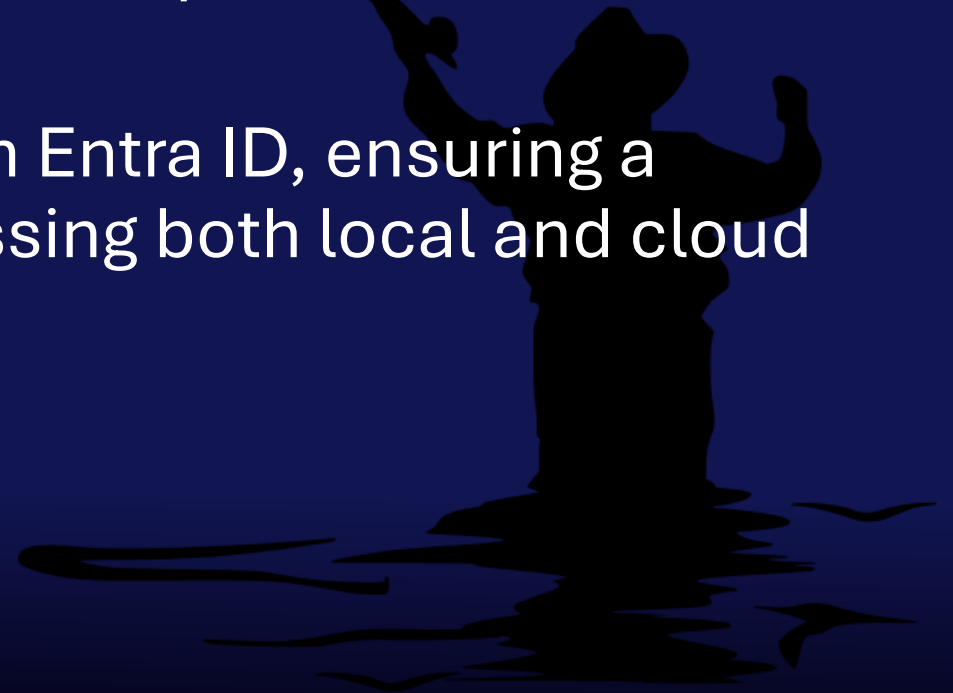

Secure Access to AVD

Using MFA and Conditional Access

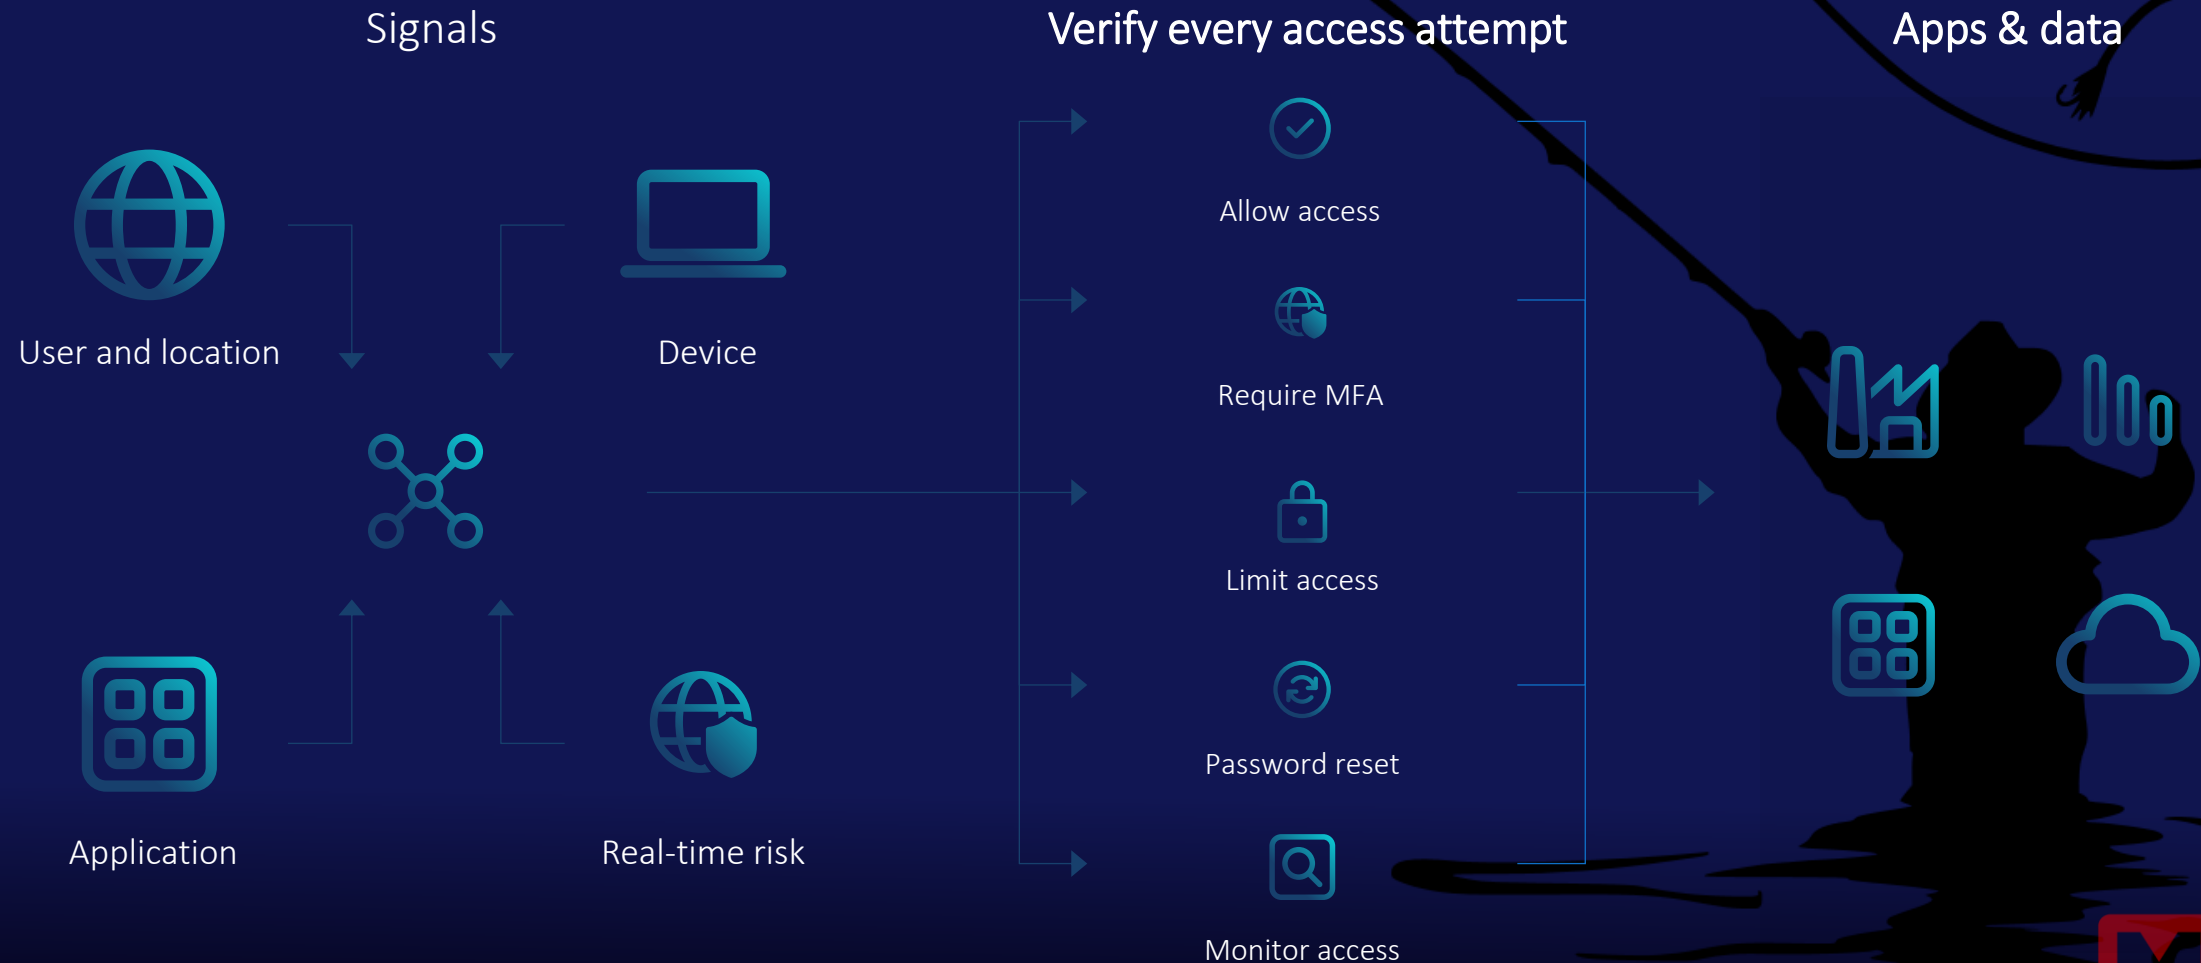

Multifactor Authentication for AVD

- ◆ Better Security: Prevents unauthorized access to remote desktops, even if user passwords are stolen or compromised.
- ◆ Reduced Breach Risk: Adding a second factor, such as a mobile app notification or biometrics, the risk of compromised credentials is reduced.
- ◆ Better User Experience: It integrates with Entra ID, ensuring a familiar login experience for users accessing both local and cloud resources.

Protect resources with Conditional Access

Enable Zero Trust with strong authentication and adaptive policies

DEMO

Config MFA CA Demo

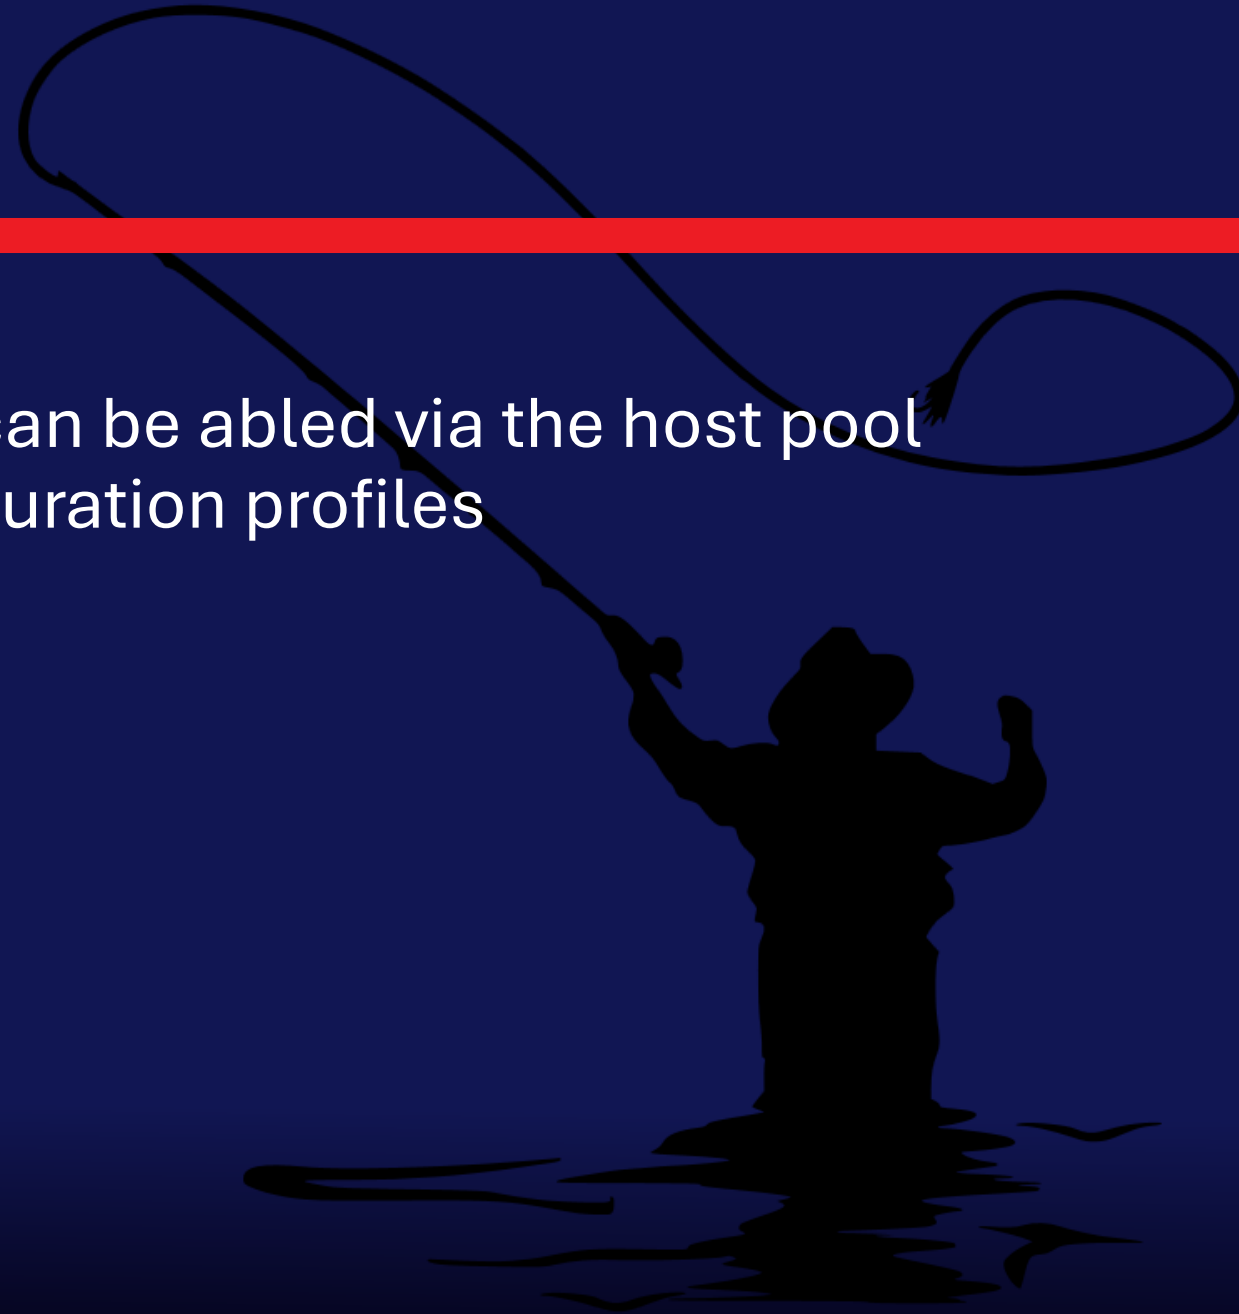

Other Conditional Access Controls for AVD

- ◆ Location
- ◆ Managed/Unmanaged device restrictions
- ◆ Types of client access, Windows App, Web app

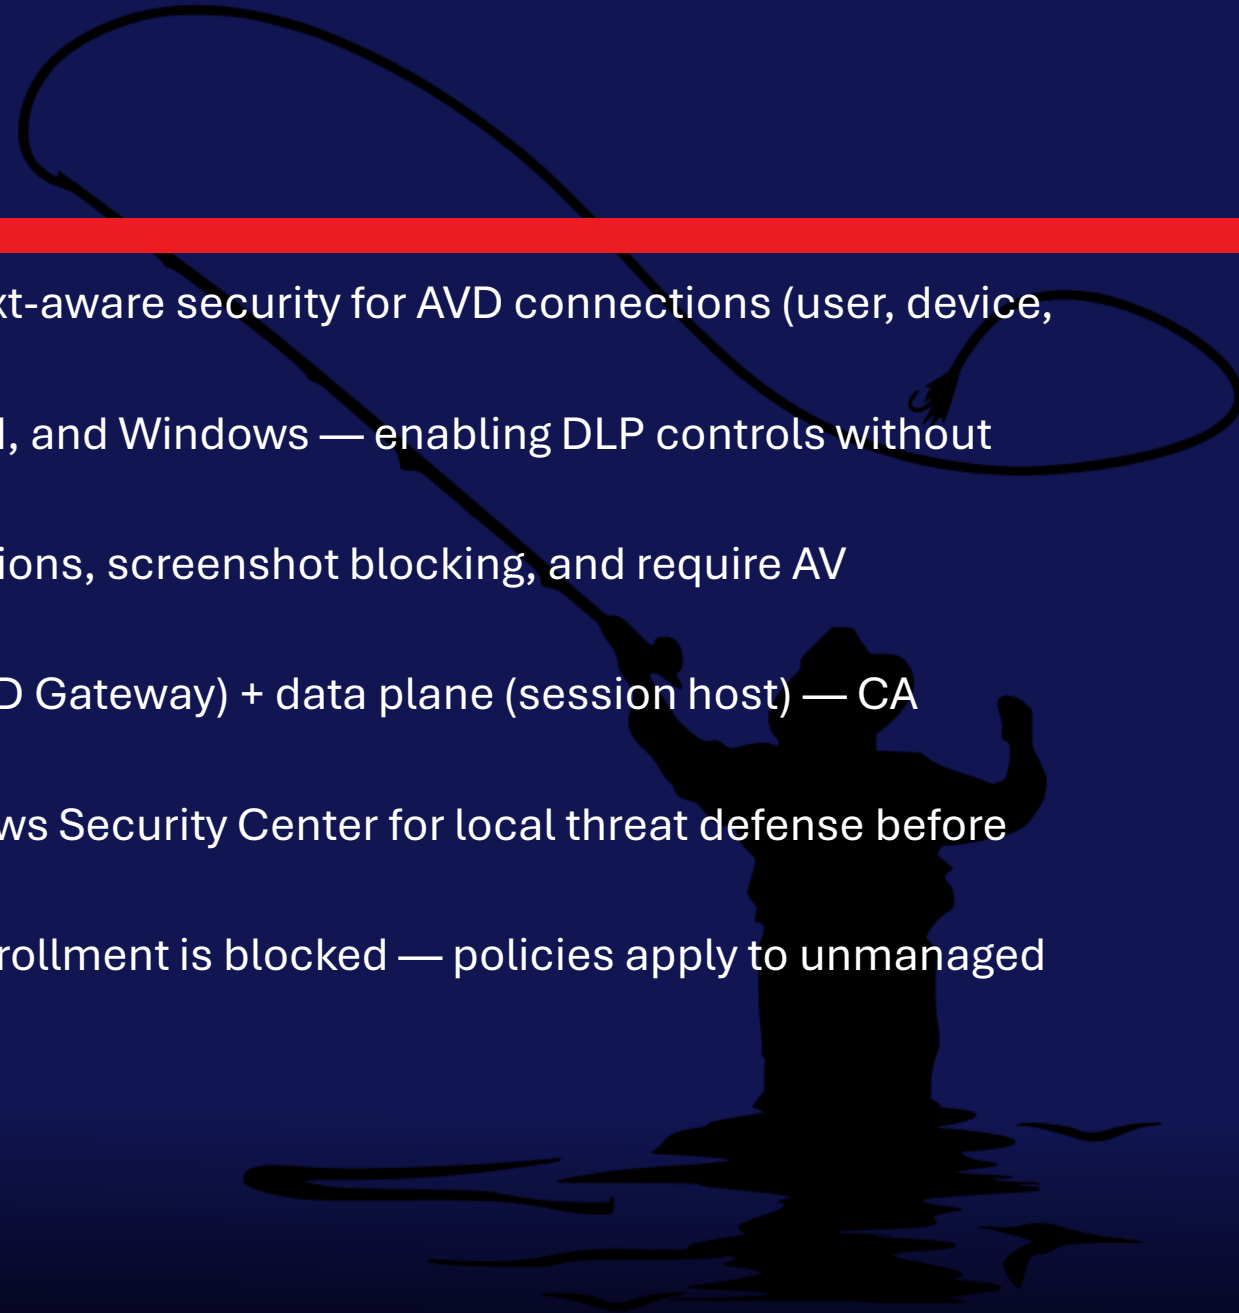

Device Redirection

- ◆ Disabled by default
- ◆ Explain how Device Redirection can be enabled via the host pool ADP properties and Intune configuration profiles
- ◆ Provide best practices
- ◆ Images

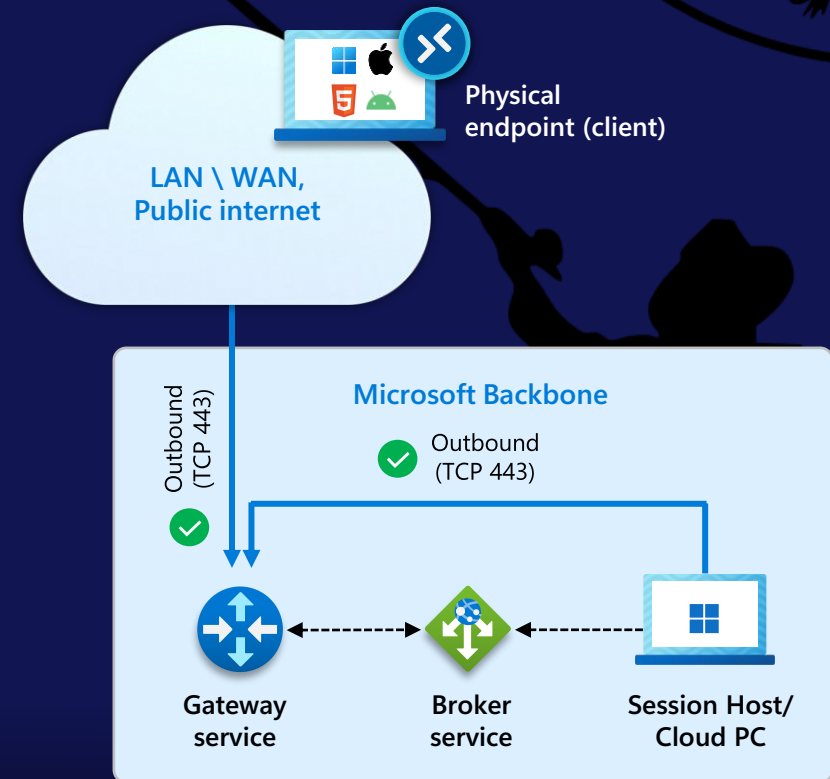

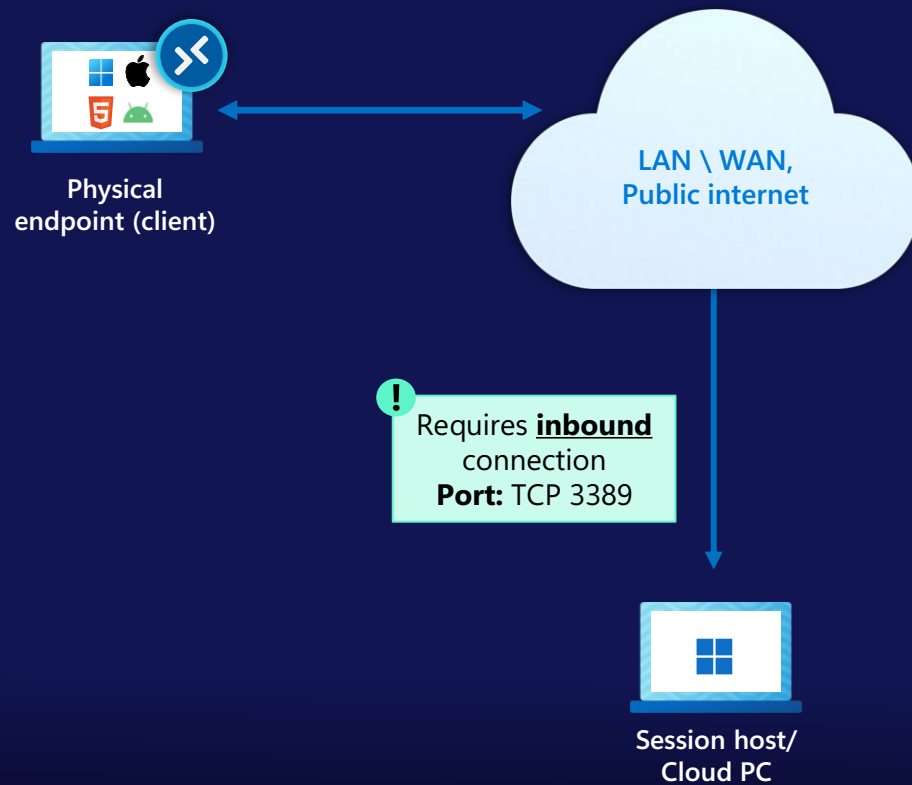

Contextual Access

- Entra ID Conditional Access policies enforce context-aware security for AVD connections (user, device, location, risk level)
- Windows App supports Intune MAM on iOS, Android, and Windows — enabling DLP controls without full device enrollment (ideal for BYOD)
- App Protection Policies manage copy/paste restrictions, screenshot blocking, and require AV installation on unmanaged devices
- Dual authentication architecture: control plane (AVD Gateway) + data plane (session host) — CA policies must target both for full protection
- MAM on unmanaged devices integrates with Windows Security Center for local threat defense before granting access
- If a device is already MDM-enrolled, Intune MAM enrollment is blocked — policies apply to unmanaged devices only

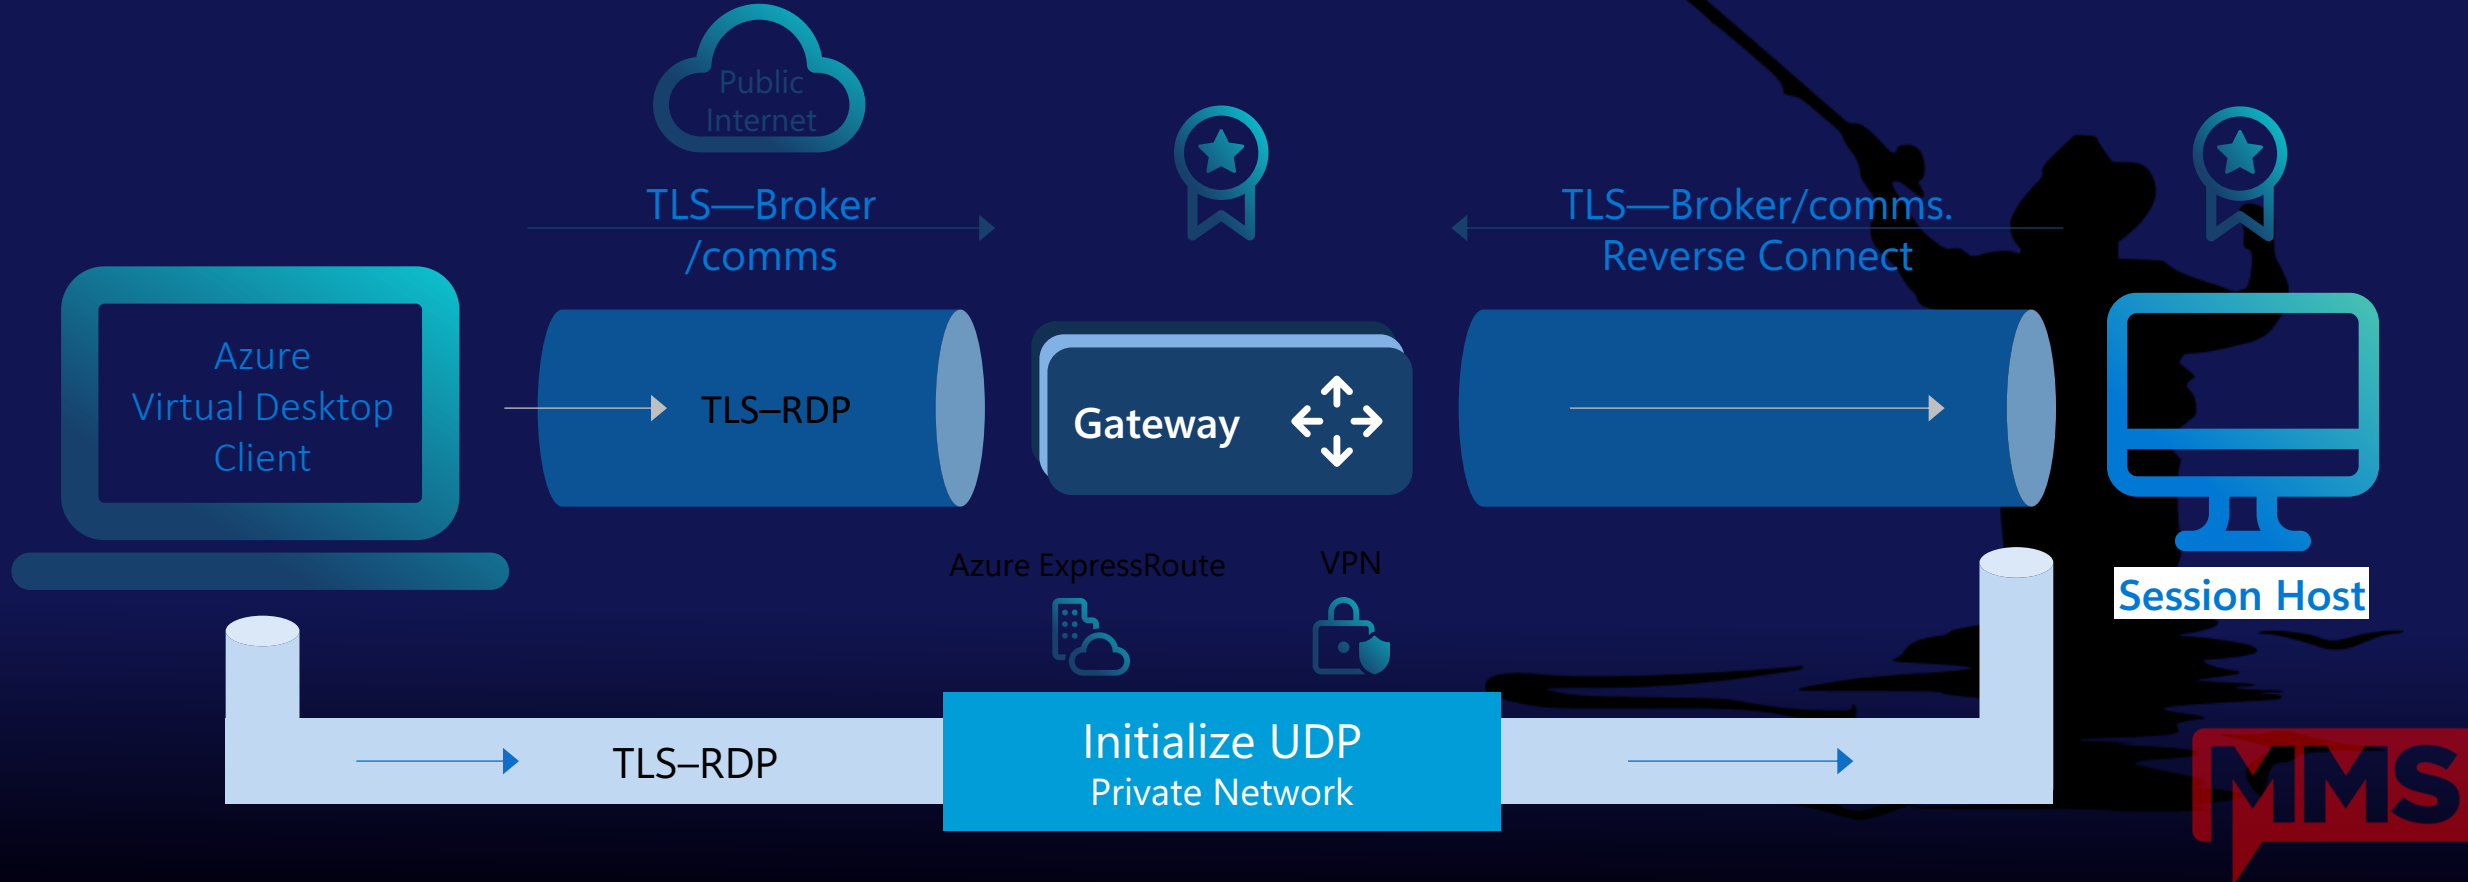

RDP client connectivity

Network Security

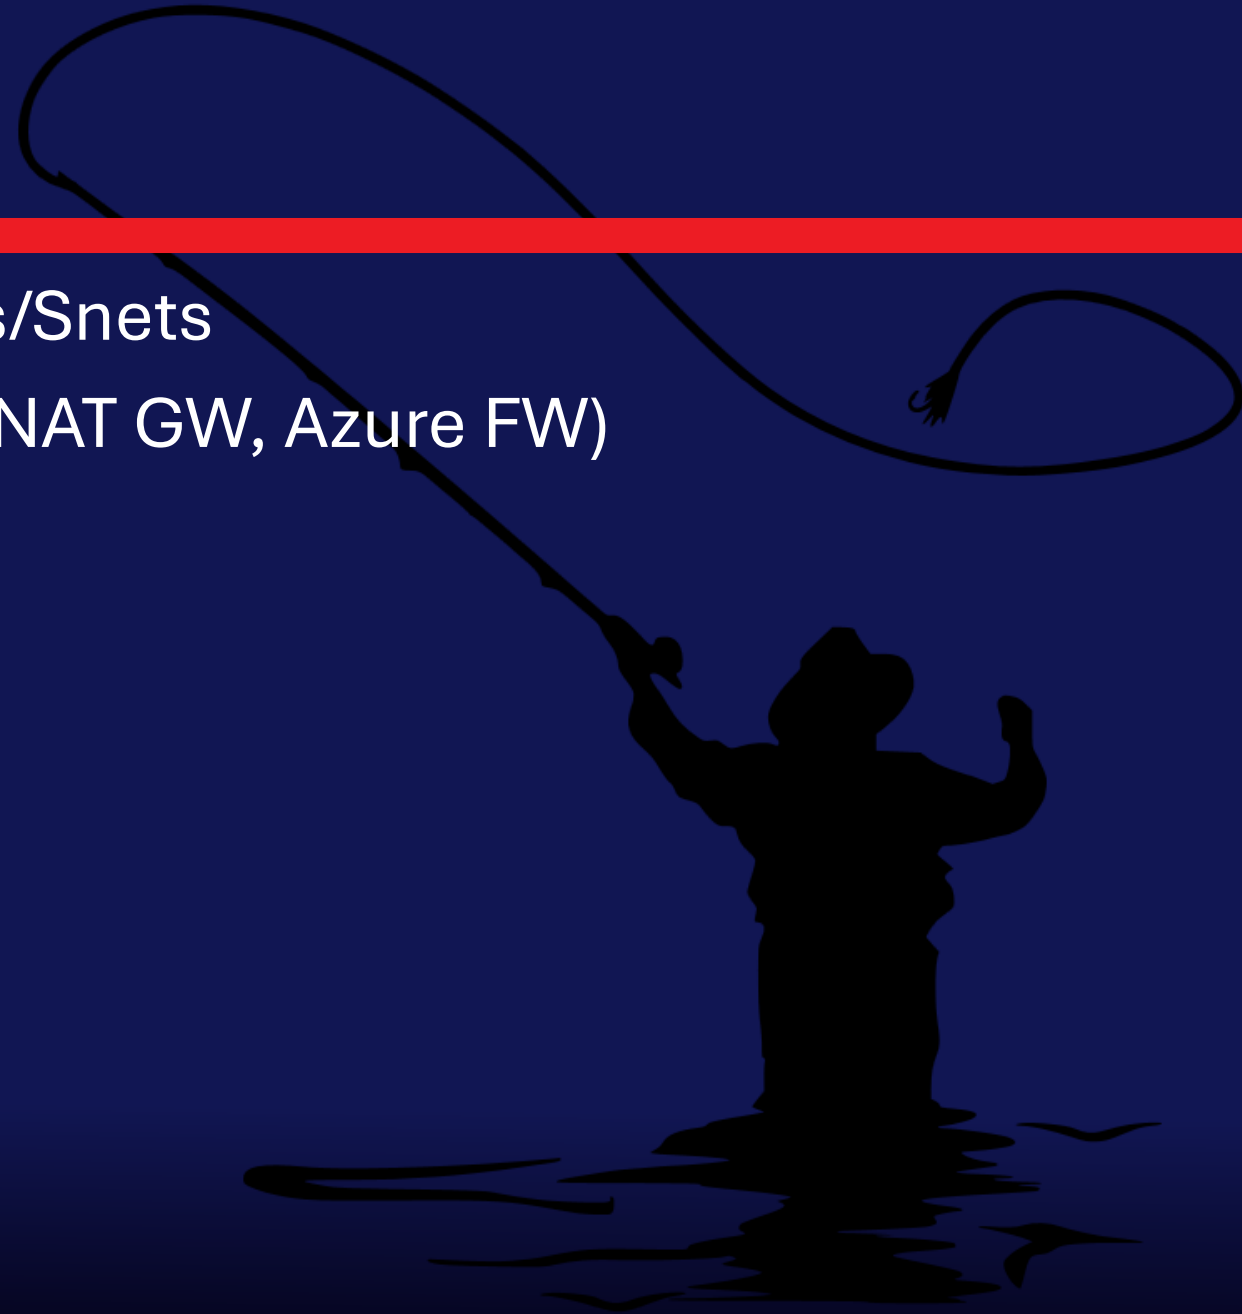

RDP Shortpath for managed networks

Redirects just the RDP traffic across your managed network directly and privately to the Azure Virtual Desktop VMs on your Virtual Network

Outbound Access

- ◆ Disabled by default on new Vnets/Snets
- ◆ Explain options, and limitations (NAT GW, Azure FW)

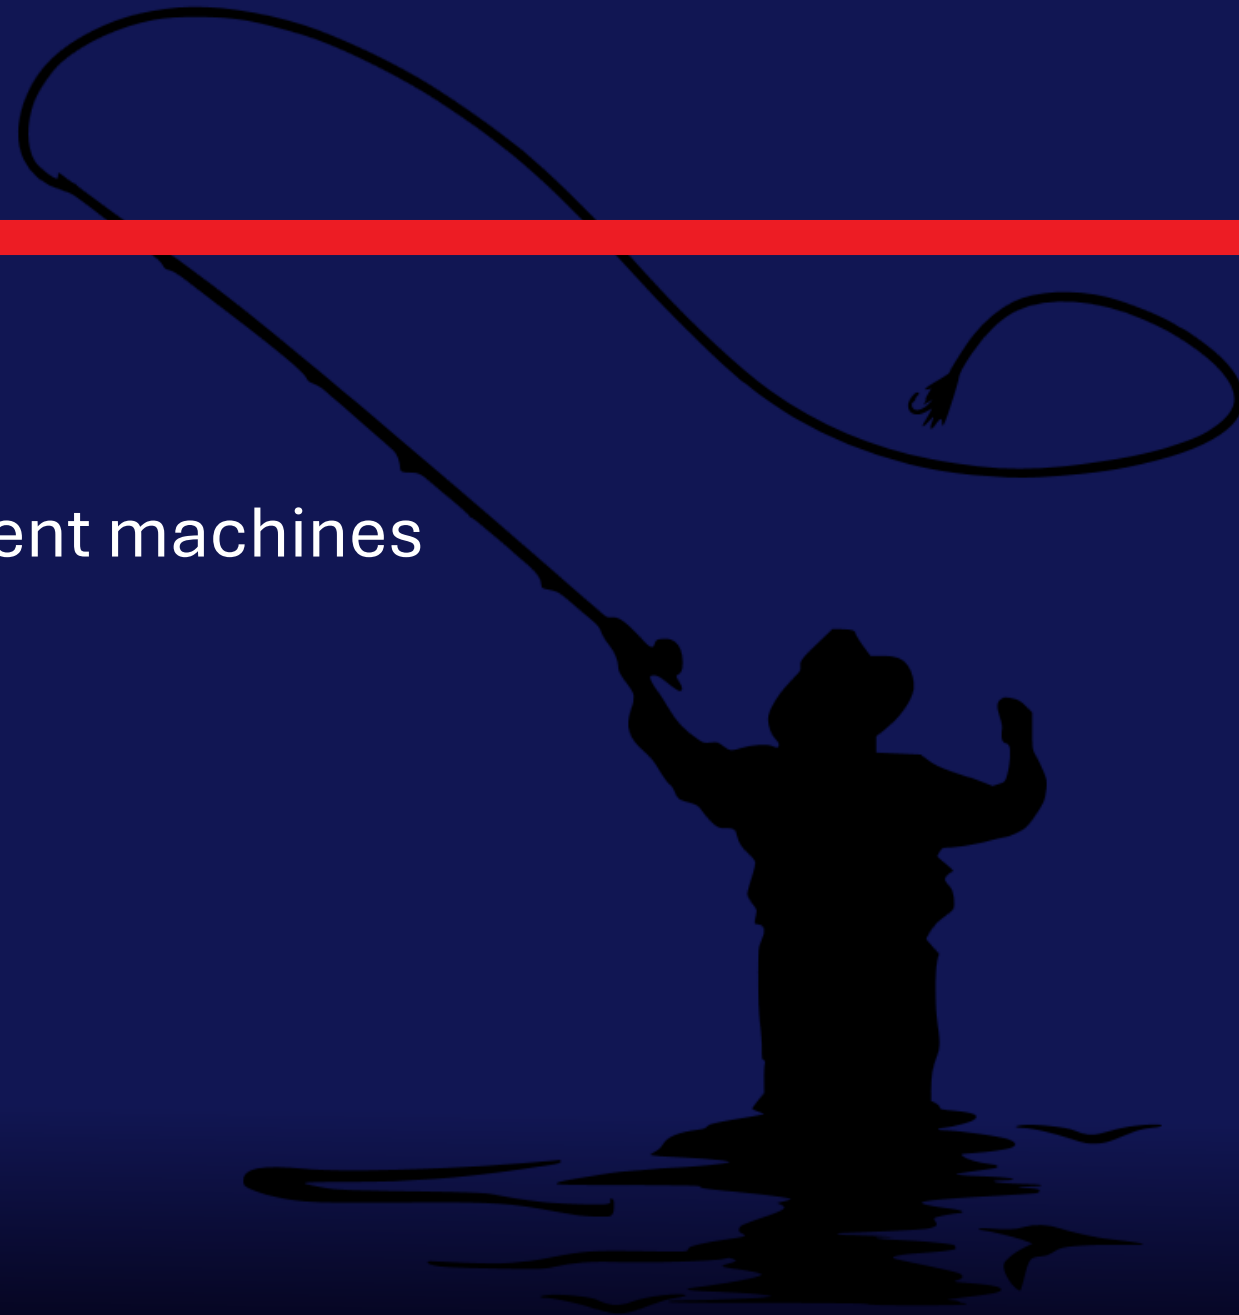

DEMO

Config Azure Firewall for outbound access?

Cloud I/O protection

- ◆ Explain what it does
- ◆ How can you configure it
- ◆ What needs to be installed on client machines
- ◆ Limitations

Private Endpoints for Storage Accounts

- ◆ Secure FSLogix Profile Container
- ◆ Private endpoints can make the SMB shares accessible within an Azure Vnet

DEMO

Adding a Private Endpoint to a Storage Account

Other security tips for AVD from MS

- ◆ Enable defender for cloud
- ◆ Monitor usage with Azure Monitor
- ◆ On session hosts
 - ◆ Enroll to Defender For Endpoint
 - ◆ Install updates
 - ◆ Configure maximum inactive time and disconnect policies
 - ◆ Screen lock for idle sessions
 - ◆ Build trusted launch session hosts
