[Introducing HybridPetya: Petya/NotPetya copycat with UEFI Secure Boot bypass](#)

KB5025885 – Black Lotus – Boot Nightmare

- ◆ Information overload – adds to the confusion.
- ◆ Microsoft – let them handle it
- ◆ DIY – 4 step process to update endpoints.
- ◆ Some steps could be “undone” by reimage, and some steps require Firmware resets to undo.
- ◆ We can monitor all 4 steps now!
- ◆ Intune has information on detection...but is it usable?
- ◆ There are some “gotchas” involved, and yes, I’ve permanently bricked a computer messing with this stuff.

The Timeline

May 9, 2023

- Initial Deployment Phase

July 11, 2023

- Second Deployment Phase

April 9, 2024, or later

- Evaluation Phase (you should be doing this)

July 9, 2024, or later

- Deployment Phase (and this)

TBA

- Enforcement Phase
- (will not begin before Jan 2026 with 6 months advance warning)

Let Microsoft handle it

- ◆ Microsoft says they will take care of this, but the details are light:

Enterprise IT-managed systems that send diagnostic data

No action is required if Windows systems at your organization receive Windows updates from Microsoft and send diagnostic data back to Microsoft. This includes devices that receive updates through Windows Autopatch, Microsoft Configuration Manager, or third-party solutions.

Note: Check that your firewall doesn't block diagnostic data. If it does, please take action to help diagnostic data reach Microsoft.

Windows diagnostic data and OEM feedback will help us group devices with similar hardware and firmware profiles to gradually release Secure Boot updates to you. This allows us to intelligently monitor the rollout process, proactively pausing, addressing any issues, and continuing as needed. Just keep your devices updated with the latest Windows updates!

[Act now: Secure Boot certificates expire in June 2026 - Windows IT Pro Blog](#)

Let Microsoft handle it (cont)

- ◆ Opt-in: Enterprise IT-managed systems that don't send diagnostic data

HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecureBoot

MicrosoftUpdateManagedOptIn REG_DWORD An opt in option.

For enterprises that want to opt-in to Controlled Feature Rollout (CFR) servicing, also known as Microsoft Managed.

In addition to setting this key, allow the sending of required diagnostic data (see Configure Windows diagnostic data in your organization).

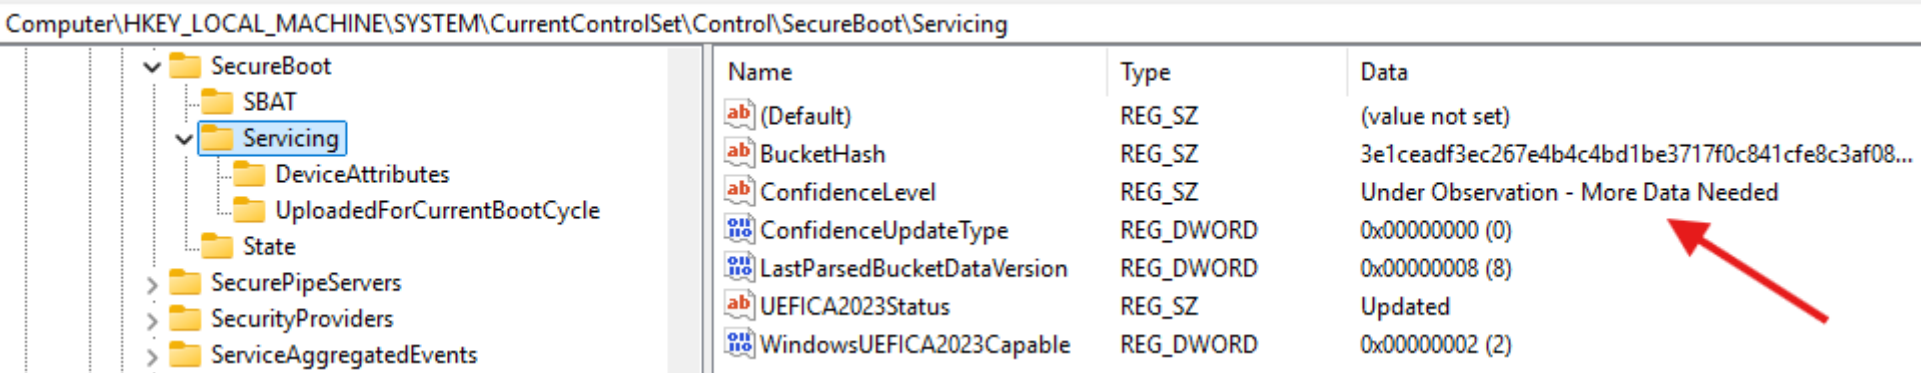

Settings

- 0 or key does not exist – Opt out
- 1 or any non-zero value – Opt in

Let Microsoft handle it (cont)

- ◆ BucketHash – The value is a hash derived from device characteristics and is used to group devices with similar firmware and platform attributes for staged deployment and risk management.
- ◆ ConfidenceLevel – ConfidenceLevel indicates the confidence assessment associated with the device's Secure Boot deployment bucket.

Name	Type	Data
(Default)	REG_SZ	(value not set)
BucketHash	REG_SZ	3e1ceadf3ec267e4b4c4bd1be3717f0c841cfe8c3af08...
ConfidenceLevel	REG_SZ	Under Observation - More Data Needed
ConfidenceUpdateType	REG_DWORD	0x00000000 (0)
LastParsedBucketDataVersion	REG_DWORD	0x00000008 (8)
UEFICA2023Status	REG_SZ	Updated
WindowsUEFICA2023Capable	REG_DWORD	0x00000002 (2)

Let Microsoft handle it: Opt-out

HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecureBoot

HighConfidenceOptOut

REG_DWORD

An opt out option.

For enterprises that want to opt out of high confidence buckets that will automatically be applied as part of the LCU.

You can set this key to a non-zero value to opt-out of the high confidence buckets.

Settings

- 0 or key does not exist – Opt in
- 1 – Opt out

The DIY Process

BIOS Update

- Update your BIOS/UEFI (yes-really you should already be doing this)

Certs

- Install updated certificate definitions to the DB
- Most BIOS updates are already including this

Boot Manager

- Update the Boot Manager
- Steps 1 & 2 can be done together

Revocation

- Enable the revocation
- Do this after everything is in place: crawl-walk-run

SVN

- Apply the Secure Version Number (SVN)
- Don't do this yet unless you want to feel real pain

Certs – Changes UEFI – Non-Breaking Change

- ◆ This step will add the following:
 - Windows UEFI CA 2023** to the DB (0x0040)
 - Microsoft Option ROM UEFI CA 2023** to the DB (0x0800)
 - Microsoft UEFI CA 2023** to the DB (0x1000)
 - Microsoft Corporation KEK 2K CA 2023** to the KEK (0x0004)
- ◆ After you apply this, you can still boot with non-patched OS / Media, as you didn't revoke anything yet.
- ◆ This is a good step to add to your OSD process
- ◆ To Apply:

```
PS C:\> $SecureBootRegPath = 'HKLM:\SYSTEM\CurrentControlSet\Control\SecureBoot'  
PS C:\> New-ItemProperty -Path $SecureBootRegPath -Name "AvailableUpdates" -PropertyType dword -Value 0x1844 -Force
```

- ◆ Run the scheduled task:
Start-ScheduledTask -TaskName '\Microsoft\Windows\PI\Secure-Boot-Update'
- ◆ Might require a reboot

Certs – Verify

- ◆ PowerShell:

Get-SecureBootUEFI -Decoded -Name DB | Where-Object {\$_.Subject -match "2023"} | Select Subject

```
PS C:\> Get-SecureBootUEFI -Decoded -Name DB | Where-Object {$_.Subject -match "2023"} | Select Subject
```

Subject

```
CN=Windows UEFI CA 2023, O=Microsoft Corporation, C=US
CN=Microsoft UEFI CA 2023, O=Microsoft Corporation, C=US
CN=Microsoft Option ROM UEFI CA 2023, O=Microsoft Corporation, C=US
```

- ◆ Get-SecureBootUEFI -Decoded -Name KEK | Where-Object {\$_.Subject -match "2023"} | Select Subject

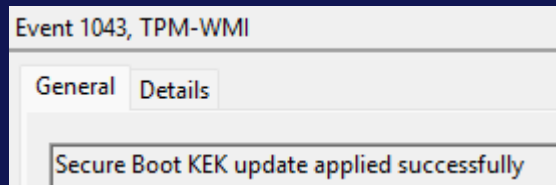

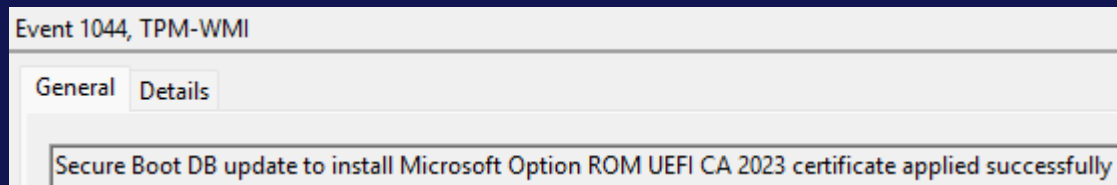

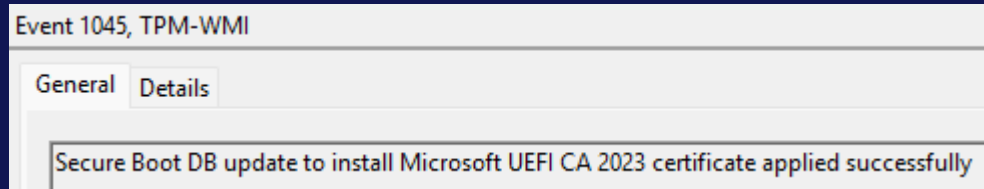

```
PS C:\> Get-SecureBootUEFI -Decoded -Name KEK | Where-Object {$_.Subject -match "2023"} | Select Subject
```

Subject

```
CN=Microsoft Corporation KEK 2K CA 2023, O=Microsoft Corporation, C=US
```

Certs – Verify

◆ Event log: Event IDs 1045, 1044, 1043

- ◆ Registry:
HKLM\SYSTEM\CurrentControlSet\Control\SecureBoot\Servicing
WindowsUEFICA2023Capable = 1 (or 2 if Boot Manager is already updated)
HKLM\SYSTEM\CurrentControlSet\Control\SecureBoot\Servicing
UEFICA2023Status = Updated

Test for Certs after updating the BIOS/UEFI

- ◆ OEMs have been pushing this via BIOS updates and new hardware releases. I just opened my new Lenovo T14s Gen6, and it was already done.

KB5025885: Windows Boot Manager revocations for Secure Boot changes
CVE-2023-24932 Remediation Summary
=====
SUCCESS: Applying the DB update | 1036 | The PCA2023 certificate was added to the DB.
=====
Not Complete: Updating the boot manager | 1799 | The PCA2023 signed boot manager was applied.
=====
Not Complete: Applying the DBX update | 1037 | The DBX update that untrusts the PCA2011 signing certificate was applied
=====
Additional Items need to be completed for CVE-2023-24932
Current Secure Boot Registry Value: 32770
=====
PS C:\Windows\System32>
```

Continue in English

Boot Manager – Non-Breaking Change

- ◆ This step will install a boot manager application on your device which is signed with the Windows UEFI CA 2023 certificate.
- ◆ This is tied to the OS you have installed, so if you reimage at this point, you'd have to install media that you pre-populated with the updated boot manager **or** update it again after OSD.
- ◆ To Apply:

```
$SecureBootRegPath = 'HKLM:\SYSTEM\CurrentControlSet\Control\SecureBoot'  
New-ItemProperty -Path $SecureBootRegPath -Name "AvailableUpdates" -PropertyType dword -Value 0x100 -Force
```
- ◆ Run the scheduled task:
Start-ScheduledTask -TaskName '\Microsoft\Windows\PI\Secure-Boot-Update'
- ◆ Might require a reboot

Boot Manager – Verify

◆ Event log: Event ID 1799

Level	Date and Time	Source	Event ID	Task Category
Information	8/13/2025 10:29:13 AM	TPM-WMI	1799	None
Event 1799, TPM-WMI				
General Details				
Boot Manager signed with Windows UEFI CA 2023 was installed successfully				

◆ PowerShell:

```
PS C:\Users\GaryBlok> #Test: Updating the boot manager
PS C:\Users\GaryBlok> $Volume = Get-Volume | Where-Object {$_.FileSystemType -eq "FAT32" -and $_.DriveType -eq "Fixed"}
PS C:\Users\GaryBlok> $SystemDisk = Get-Disk | Where-Object {$_.IsSystem -eq $true}
PS C:\Users\GaryBlok> $SystemPartition = Get-Partition -DiskNumber $SystemDisk.DiskNumber | Where-Object {$_.IsSystem -eq $true}
PS C:\Users\GaryBlok> $SystemVolume = $Volume | Where-Object {$_.UniqueId -match $SystemPartition.Guid}
PS C:\Users\GaryBlok> $FilePath = "$($SystemVolume.Path)\EFI\Microsoft\Boot\bootmgfw.efi"
PS C:\Users\GaryBlok> $CertCollection = New-Object System.Security.Cryptography.X509Certificates.X509Certificate2Collection
PS C:\Users\GaryBlok> $CertCollection.Import($FilePath, $null, 'DefaultKeySet')
PS C:\Users\GaryBlok> If ($CertCollection.Subject -like "*Windows UEFI CA 2023*") {$true} else {$false}
True
PS C:\Users\GaryBlok>
```

Boot Manager – Verify (cont)

- ◆ Registry:
HKLM\SYSTEM\CurrentControlSet\Control\SecureBoot\Servicing
WindowsUEFICA2023Capable = 2
- ◆ Note: Event ID 1800 will indicate if a reboot is required:

Level	Date and Time	Source	Event ID	Task C...
Warning	8/12/2025 4:51:26 PM	TPM-WMI	1800	None

Event 1800, TPM-WMI

General Details

A reboot is required before installing the Secure Boot update. Reason: 3

Apply Certs & Boot Manager together

- ◆ Both Certs and Boot Manager can be applied with a single registry key
- ◆ In some cases, it will require at least 2 reboots
- ◆ Set:
HKLM\SYSTEM\CurrentControlSet\Control\Secureboot
AvailableUpdates=0x5944 (REG_DWORD)
- ◆ Run the scheduled task:
Start-ScheduledTask -TaskName '\Microsoft\Windows\PI\Secure-Boot-Update'
- ◆ Likely will require one or more reboots

Enable Revocation – *Breaking Change*

- ◆ The UEFI Forbidden List (DBX) is used to block untrusted UEFI modules from loading. In this step, updating the DBX will add the “Windows Production CA 2011” certificate to the DBX. This will cause all boot managers signed by this certificate to no longer be trusted.
- ◆ At this point, the device will no longer PXE boot, or boot to your unmodified boot media.
- ◆ Apply:

```
$SecureBootRegPath = 'HKLM:\SYSTEM\CurrentControlSet\Control\SecureBoot'  
New-ItemProperty -Path $SecureBootRegPath -Name "AvailableUpdates" -PropertyType dword -Value 0x80 -Force
```
- ◆ Run the scheduled task:

```
Start-ScheduledTask -TaskName '\Microsoft\Windows\PI\Secure-Boot-Update'
```
- ◆ Might require a reboot

Revocation – Verify

◆ Event log: Event ID 1037

Level	Date and Time	Source	Event ID	Task C...
Information	8/12/2025 4:57:36 PM	TPM-WMI	1037	None
Event 1037, TPM-WMI				
General Details				
Secure Boot Dbx update to revoke Microsoft Windows Production PCA 2011 is applied successfully				

◆ PowerShell:

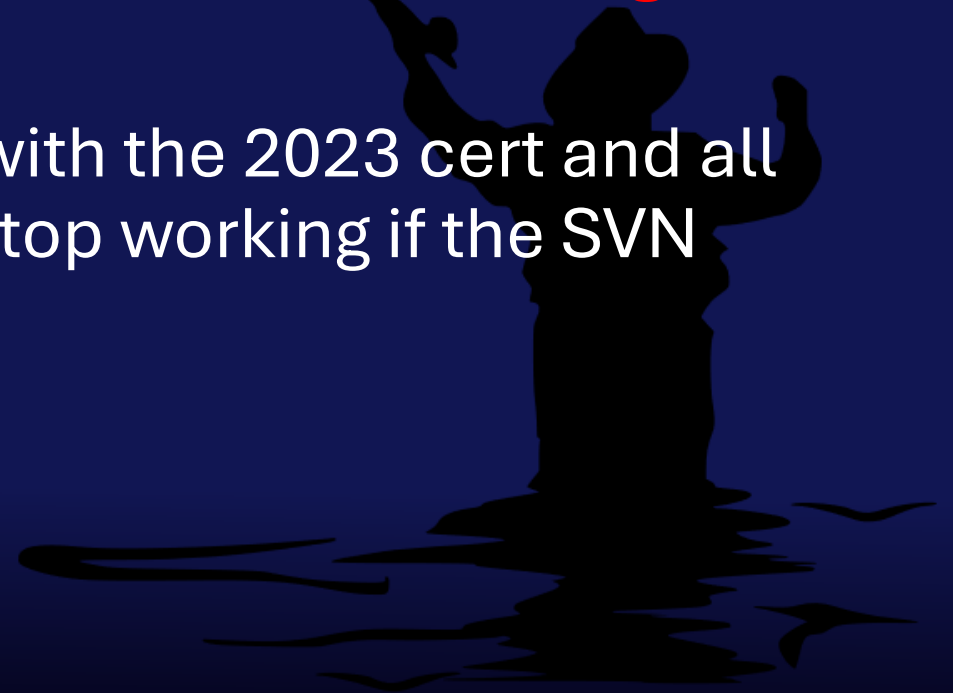

```
PS C:\Users\Administrator> [System.Text.Encoding]::ASCII.GetString((Get-SecureBootUEFI dbx).bytes) -match 'Microsoft Windows Production PCA 2011'
True
```

◆ Note: Event ID 1800 will indicate if a reboot is required:

Level	Date and Time	Source	Event ID	Task C...
Warning	8/12/2025 4:51:26 PM	TPM-WMI	1800	None
Event 1800, TPM-WMI				
General Details				
A reboot is required before installing the Secure Boot update. Reason: 3				

Apply SVN update – ***Breaking Change***

- ◆ The Boot Manager checks its SVN against the one in the Firmware. This prevents rolling back to an older boot manager.
- ◆ MS will continually update the SVN as “significant” security issues are fixed in the Boot Manager, so this will forever be a **moving target**.
- ◆ This means, if you updated Boot Media with the 2023 cert and all is working, in a month or two... it could stop working if the SVN gets updated. (Ask me how I know)
- ◆ ***NEW*** we can now test for the SVN.

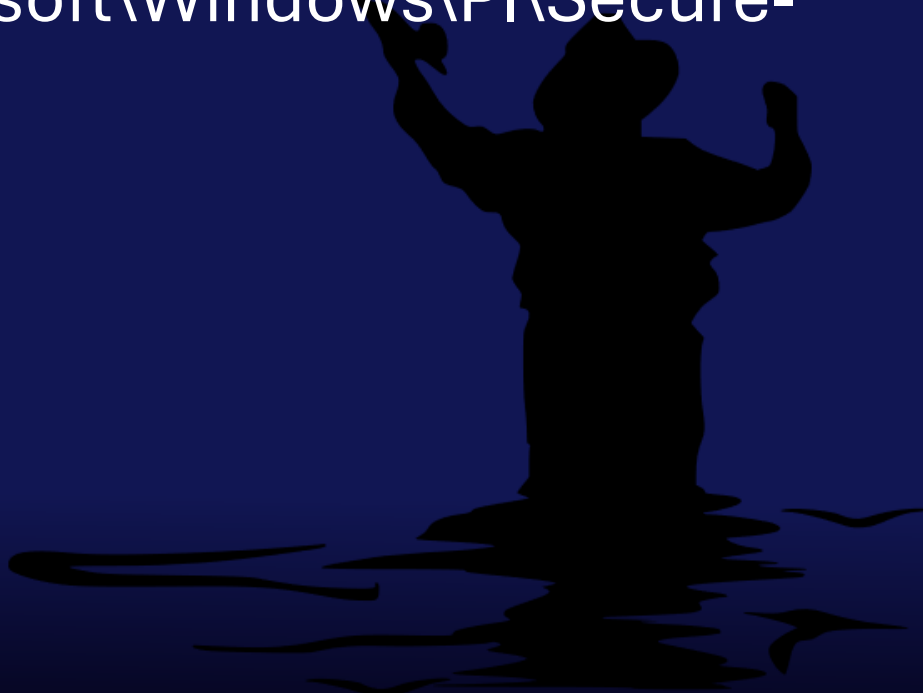

Apply SVN update – ***Breaking Change***

- ◆ Apply:

```
$RegPath = 'HKLM:\SYSTEM\CurrentControlSet\Control\SecureBoot'  
New-ItemProperty -Path $RegPath -Name 'AvailableUpdates' -PropertyType dword -Value 0x200 -Force
```

- ◆ Run the scheduled task:
Start-ScheduledTask -TaskName '\Microsoft\Windows\PI\Secure-Boot-Update'
- ◆ Might require a reboot

SVN – Verify

◆ Event log: Event ID 1042

Information	3/20/2026 3:32:48 PM	TPM-WMI	1042	None
Error	3/19/2026 2:11:40 PM	TPM-WMI	1801	None
Information	3/19/2026 2:07:04 PM	TPM-WMI	1025	None
Information	3/19/2026 2:07:04 PM	TPM-WMI	1282	None
Information	3/19/2026 2:07:04 PM	TPM-WMI	1537	None
Information	3/19/2026 2:06:43 PM	TPM-WMI	1038	None
Information	3/19/2026 2:06:43 PM	TPM-WMI	1041	None
Information	3/17/2026 12:14:54 AM	TPM-WMI	1034	None

Event 1042, TPM-WMI

General Details

Secure Boot Dbx update to revoke older Boot Manager SVN is applied successfully

◆ PowerShell:

```
PS C:\> Get-SecureBootSVN

FirmwareSVN      : 7.0
BootManagerSVN   : 7.0
StagedSVN        : 7.0
ComplianceStatus : Compliant (Boot Manager SVN meets staged SVN)
BootManagerPath  : \\.\HarddiskVolume1\EFI\Microsoft\Boot\bootmgfw.efi
```

Apply Revocation & SVN together– ***Breaking Change***

- ◆ Apply:

```
$SecureBootRegPath = 'HKLM:\SYSTEM\CurrentControlSet\Control\SecureBoot'  
New-ItemProperty -Path $SecureBootRegPath -Name "AvailableUpdates" -PropertyType dword -Value 0x280 -Force
```

- ◆ Run the scheduled task:

```
Start-ScheduledTask -TaskName '\Microsoft\Windows\PI\Secure-Boot-Update'
```

- ◆ Might require a reboot

Implementation & Monitoring

- ◆ Intune report?
- ◆ Monitor with Baselines or Remediations
- ◆ You can safely rollout Certs and Boot Manager every where, starting last year.
- ◆ Then start to apply the revocation (and maybe the SVN) to your test machines and start prep your solutions to accommodate post remediated machines

Updating Boot and Recovery Media

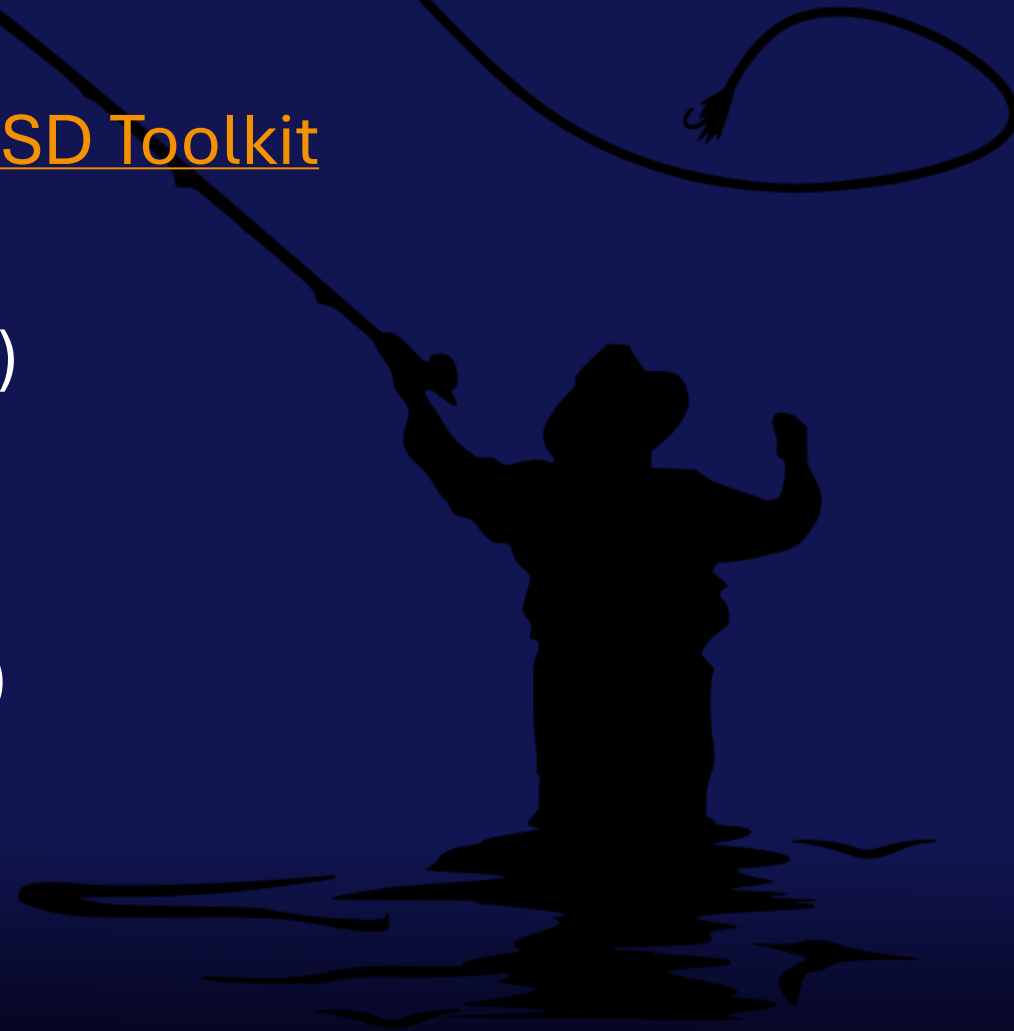

- ◆ THIS IS A PAIN IN THE BOOT... WIM - Changes for 24H2 (Dec 2024) ADK 10.1.26100.2454: (don't use 10.1.28000.1 – it is broken)
- CopyPE was updated to support staging boot binaries signed with the new "Windows UEFI CA 2023" CA.
- MakeWinPEMedia.cmd script to leverage these new binaries for creating bootable with the /bootex
- Guess what, on the 24H2 (Dec 2024) ADK, it doesn't even boot a recently remediated device due to the SVN. You still need to apply CU's to your boot.wim to update the SVN of your boot media.

[Download and Install the Windows ADK Patches | Microsoft Learn](#)

Updating Boot Images (WinPE)

Order of Operations:

- ◆ Add BranchCache using the free [2Pint OSD Toolkit](#)
- ◆ Add Optional Components
- ◆ Apply SSU (it is in an earlier CU for 24H2)
- ◆ Apply CU
- ◆ Perform Component Cleanup
- ◆ Add Extra Files (i.e. smsts.ini, certs, etc.)
- ◆ Inject Drivers (*can also be done in CM)
- ◆ Export Boot Image to reduce size

One-Time Boot Settings

Control the boot flow for the SupportAssist OS Recovery Tool.

NOTE:

Once a system and/or admin password is set, the system will always prompt for system and/or admin password during boot.

UEFI Boot Devices

Windows Boot Manager

UEFI RST KBG50ZNS256G NVMe
KIOXIA 256GB 33IC13SYEW9X

UEFI Kingston DataTraveler 3.0
A9654DB818C4000000008288

UEFI HTTPs Boot

ONBOARD NIC (IPV4)

ONBOARD NIC (IPV6)

Pre-Boot Tasks

Change important BIOS settings on your system, configure how your device works and troubleshoot issues using this interface.

BIOS SETUP

Configure BIOS options and control how your system functions.

DIAGNOSTICS

Run system tests to identify any issues.

BIOS UPDATE

Search for and install the latest BIOS updates from various services.

SupportAssist OS Recovery

Analyze, repair and restore your system.

BIOS Flash Update - Remote

BIOS and Firmware Update Over-the-Air

Device Configuration

Configure device settings

WARNING

If optional components are added through Configuration Manager on a boot image that has a cumulative update, then the optional components aren't updated with the cumulative update. **Adding the optional components through Configuration Manager could lead to unexpected behaviors and problems.** The cumulative update needs to be added after the optional components have been added to the boot image for the optional components to be updated properly with the cumulative update.

What to do when things go wrong

- ◆ Painful Workaround:
 - ◆ Disable Secure Boot
 - ◆ Reimage Device or Patch with latest CU
 - ◆ Enable Secure Boot
 - ◆ Run Remediation Again
- ◆ You can also reset the Secure Boot Keys to Factory in the BIOS Menu if needed (not all OEMs or Models support this) *Make sure you keep your BIOS updated!!

Security Error: Secure boot version check failed.
Your system security may be compromised!

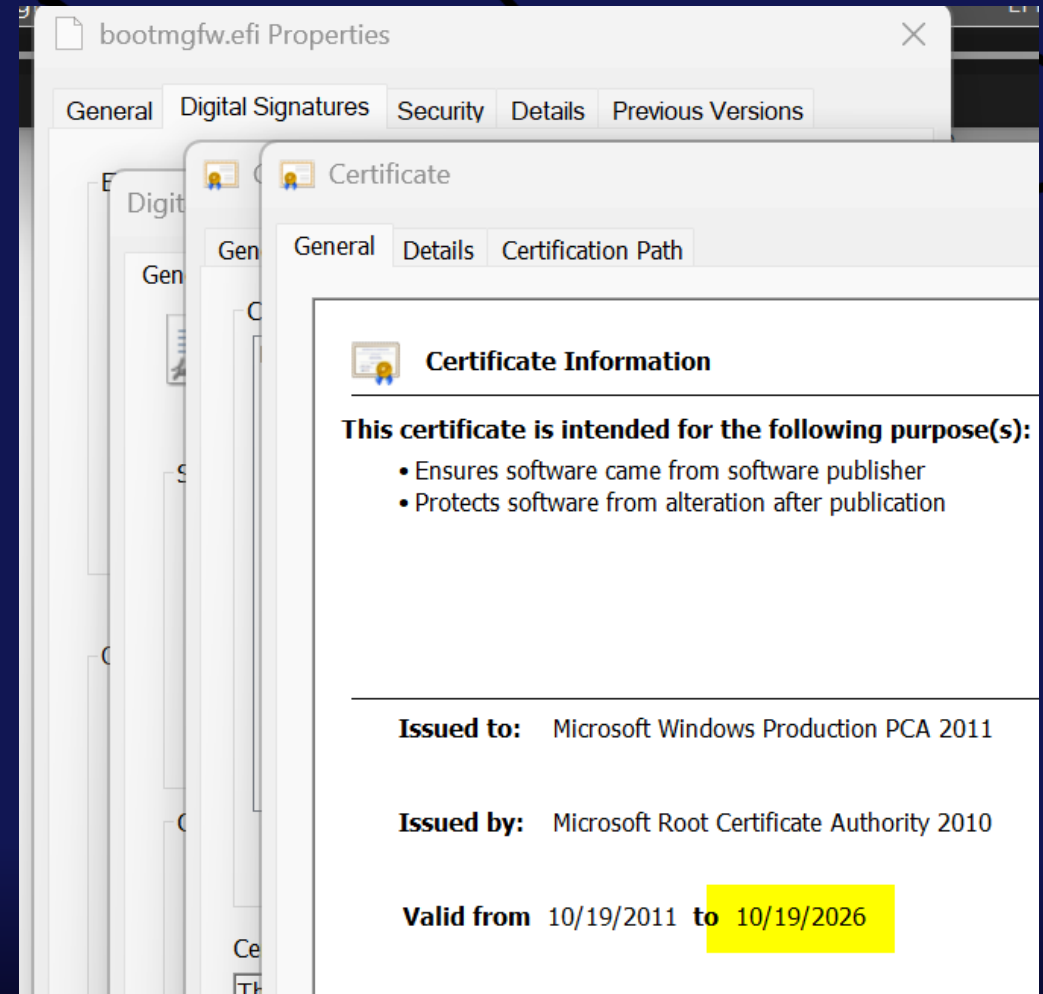

Current version: 3.0 - Minimum allowed version: 7.0
Visit <https://aka.ms/secure-boot-version-violation> for more information.

The system will shutdown in 10 seconds.

.....

Our Recommendation for when you get back

- ◆ START TODAY! (or next week)
- ◆ Perform the Cert and Boot Manager updates, they are non-breaking, and if you want to do it in a way that is “seamless” to users, it can take awhile to implement.
